Natural Image OC is based on the premise that cosmetic surgery doesn't have to leave you looking as if you had surgery. "Old School" surgical techniques created over-tightened, flat, wind-swept appearances that shouted "I've had plastic surgery!" Who wants that??

Dr. Sikorski's earlier training in Fine Arts gave her plenty of background in understanding how to create – and recreate – natural facial contours through surgery.

For 15 years she perfected artistic talents through drawing, painting and sculpting as a primary educational pursuit. Transitioning into Cosmetic Surgery put those finely honed skills and training to work right away.

Welcome!

Welcome to our first newsletter!

We hope you'll find these issues interesting and informative, as we present details about the latest aesthetic technologies, most effective procedures and important new discoveries. Each issue will also include information about current specials and upcoming seminars.

If there are any topics you would especially like to know more about, simply [click here](#) to let us know! We can answer your questions and provide more detailed information in future issues.

Please feel free to forward these issues to any friends who you think might be interested in this information. If you would prefer to not receive any further issues, just click the "unsubscribe" link at the bottom and we will remove you from our mailing list.

Botox and Dysport: Instant, Natural Wrinkle Reduction

Wrinkling near the eyes and in the forehead is one of the earliest signs of aging. Even relatively young people can develop lines in these areas as a result of stress or excess sun exposure, making them look older than they actually are.

Fortunately, this problem is one of the easiest to correct. FDA approved for the treatment of lines and wrinkles, Botox and Dysport can quickly restore a natural, youthful look to the face.

Injection with Botox takes about 15 minutes. Shortly thereafter, Botox begins blocking nerve transmission to specific muscles, putting those muscles to rest for the next few months. That causes wrinkles in the affected muscles to virtually disappear.

Dysport is a similar product that was introduced in 2009. Like Botox, it contains Botulinum toxin type A, a neuromodulator that can be used to soften expression-based wrinkles that originate in the facial muscles.

Both products have strong safety records and are particularly well suited to correction of wrinkling between the eyes, around the eyes

Latisse: save \$21

Bundle price: \$274.40

(25% savings off original prices)

(crow's feet) and the forehead.

However, clinicians have observed less swelling following Dysport injections as compared to Botox - a benefit for those seeking to keep their procedure private or pop in for a lunchtime treatment. A second advantage over Botox is the onset of action with Dysport: while Botox generally takes effect within three to four days, Dysport starts working within one or two days. The results of both last approximately three to four months.

Sclerotherapy Effectively Removes Discolored Veins

Varicose veins are an often painful problem that affects more than 40 million people in the United States. They are particularly common among people who are overweight, pregnant, or have an occupation that requires long periods of standing. Varicose veins also occur more frequently with age.

The twisted, discolored veins are the result of faulty valves in the veins and weakened vein walls. Normally, the one-way valves in these veins keep blood flowing toward the heart. When these valves do not function properly, blood pools, pressure builds up, and the veins become enlarged, and twisted.

Sclerotherapy, however, is an established medical procedure that can restore proper blood flow and eradicate malfunctioning veins. This technique requires injection of a special chemical (sclerosant) into a varicose vein to damage and scar the inside lining of the vein, thereby causing the vein to close.

During this procedure, the affected leg is elevated to drain blood, and the sclerosant is injected into the varicose vein. The procedure takes 5 to 30 minutes, depending on how many varicose veins are treated and how big they are.

After the injection of sclerosant, pressure is applied over the treated veins to prevent blood return during standing. This is accomplished thru the usage of compression stockings or elastic bandages for several days or weeks following treatment.

Thermage Tightens Skin on Both Face and Body

The Thermage ThermoCool is a radio frequency system that was introduced in 2002 to help tighten the skin. With more than 100,000 procedures performed so far and extensive coverage by a variety of national news programs as well as the Oprah Winfrey Show, ThermoCool has been shown to help firm skin that has lost elasticity over time. Areas that respond especially well include the brow, jawline and eye area.

In 2007, the U.S. Food & Drug Administration (FDA) cleared the device for treatment of wrinkles on the upper and lower eyelids. This makes Thermage the only FDA-approved device able to tighten the delicate skin around the eyes; it also makes ThermoCool an easy, non-invasive alternative to plastic surgery.

Thermage is also now approved for treatment of the lips. Just as Thermage can tighten the skin to erase lines and wrinkles on other areas of the face, it is now approved to help diminish fine lines around the lips for fuller shape and more definition.

During treatment with Thermage, radio frequency energy is delivered quickly and painlessly to the targeted area. This energy heats the collagen deep within the skin, causing a twofold reaction. First, existing collagen contracts and remodels for a tightening effect; second, new collagen is produced, providing further support and firmness to the skin. This process continues for several months after treatment, so that results continue to improve during this time.

But Thermage isn't just for the face – the device has also been approved for use on the body to address wrinkles and skin laxity on the arms, thighs, buttocks, abdomen, legs and hands.

"Hands by Thermage" uses a specially designed treatment tip to improve sagging skin and diminish the appearance of veins on the hands. In a clinical trial of 40 patients, most participants noticed an immediate skin tightening effect with continued improvement over the next several months as new collagen formed. "Tummy by Thermage" helps provide firmness for patients experiencing post partum or post weight loss sagging skin.

Thermage may now also be used to treat the upper and lower eyelids as well as the lips. The new "Lips by Thermage", is a non-invasive procedure to help smooth and tighten skin for fuller, more defined looking lips and decreased fine lines.

Liposuction Creates Permanent Curves

After more than 10 years as America's most popular surgical beauty fix, liposuction remains the only tried and true method to permanently reshape the body.

It's so effective that in 2009, more than 450,000 liposuction procedures were performed in the United States, according to the American Society for Aesthetic Plastic Surgery (ASAPS).

Interest in liposuction remains strong because it's still the only way to re-sculpt the body in just one procedure. The technique is considered permanent, because the fat cells that are removed can never re-grow.

Results are especially good for those who have tried dieting and exercise but are still unable to lose the last few pounds. In these cases, liposuction can be used to smooth the tummy, thighs and love handles. Liposuction can also be used, though, to reshape smaller areas like the chin and neck. This can provide more definition to these areas, creating a leaner and more graceful silhouette.

During the 1 – 2 hour procedure, fat deposits beneath the skin are removed through a hollow stainless steel tube called a cannula. Small areas can be addressed in an outpatient procedure using a local anesthetic; for large areas or when several regions are treated, general anesthesia is used. Most patients can return to work in a week or two.

For more details about liposuction, to view before and after photos, or to see a 3D representation of how the procedure is performed, please [click here](#).
